# Table of Contents

# Executive Summary

- Revenue shows steady growth across 6 months
- Coffee contributes 38% of total revenue
- Morning sales (7 AM – 10 AM) contribute 45% of total revenue
- Hell's Kitchen leads with 34% revenue share
- Consistent increase from January to June
- June recorded highest performance
- Sales decline towards month-end

The coffee shop is performing well with strong and growing customer demand, however growth is concentrated in specific areas, which creates clear opportunities for expansion.

Objective

- Evaluate overall sales performance
- Identify key revenue drivers
- Understand customer behavior
- Analyze date-time and location trends
- Provide actionable recommendations

Overview

- Transaction-level sales data
- 3 store locations
- Product categories and pricing
- Time-based sales insights
- Customer behavior indicators

**To sustain growth and improve responsiveness, real-time data monitoring will be implemented to track performance as it happens, enabling faster decision-making and operational efficiency.**

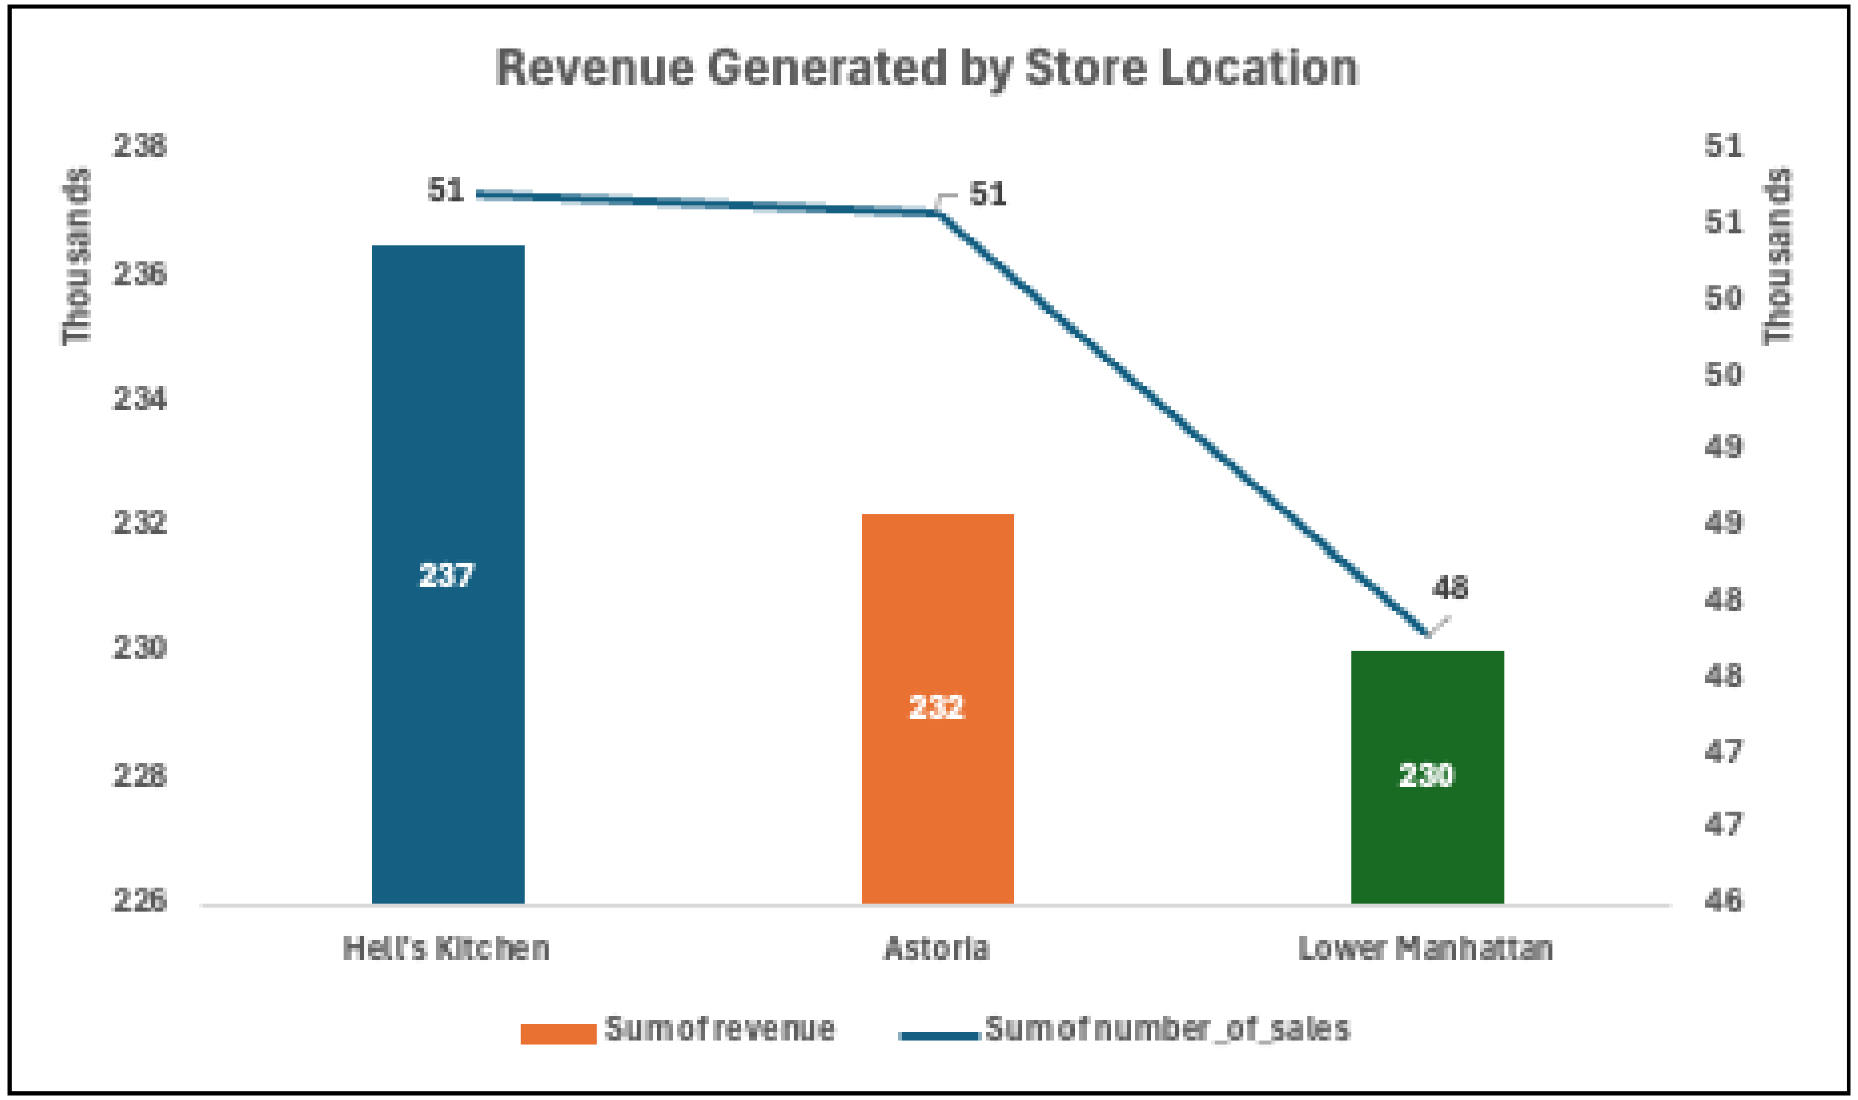
**Tea**

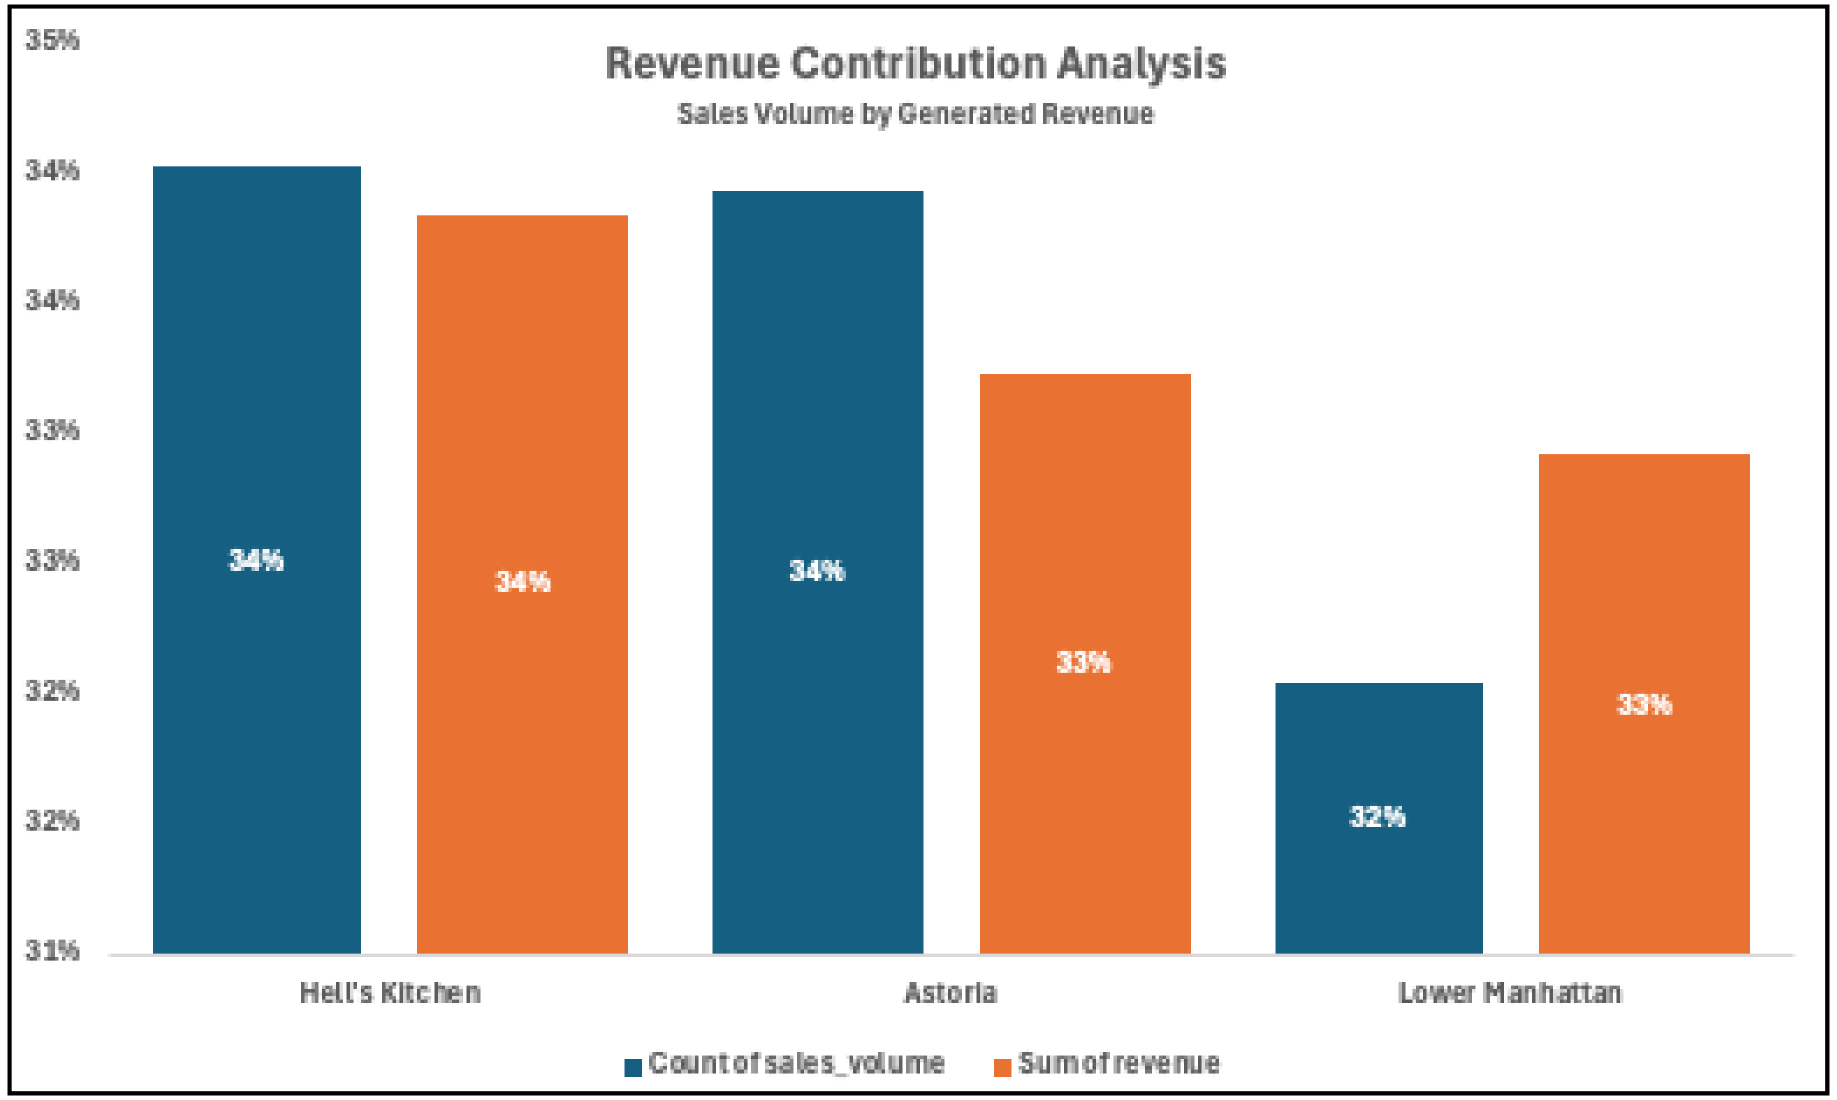
**Coffee**

**Bakery**

# Revenue Analysis | Regional, Revenue and Sales Volume Performance

- Hell's Kitchen is our premium store, it generated the most revenue, contributing 34% to the total revenue, followed by Astoria and Lower Manhattan, each at 33%.
- Lower Manhattan shows stronger sales efficiency, generating more revenue at lower sales volume.





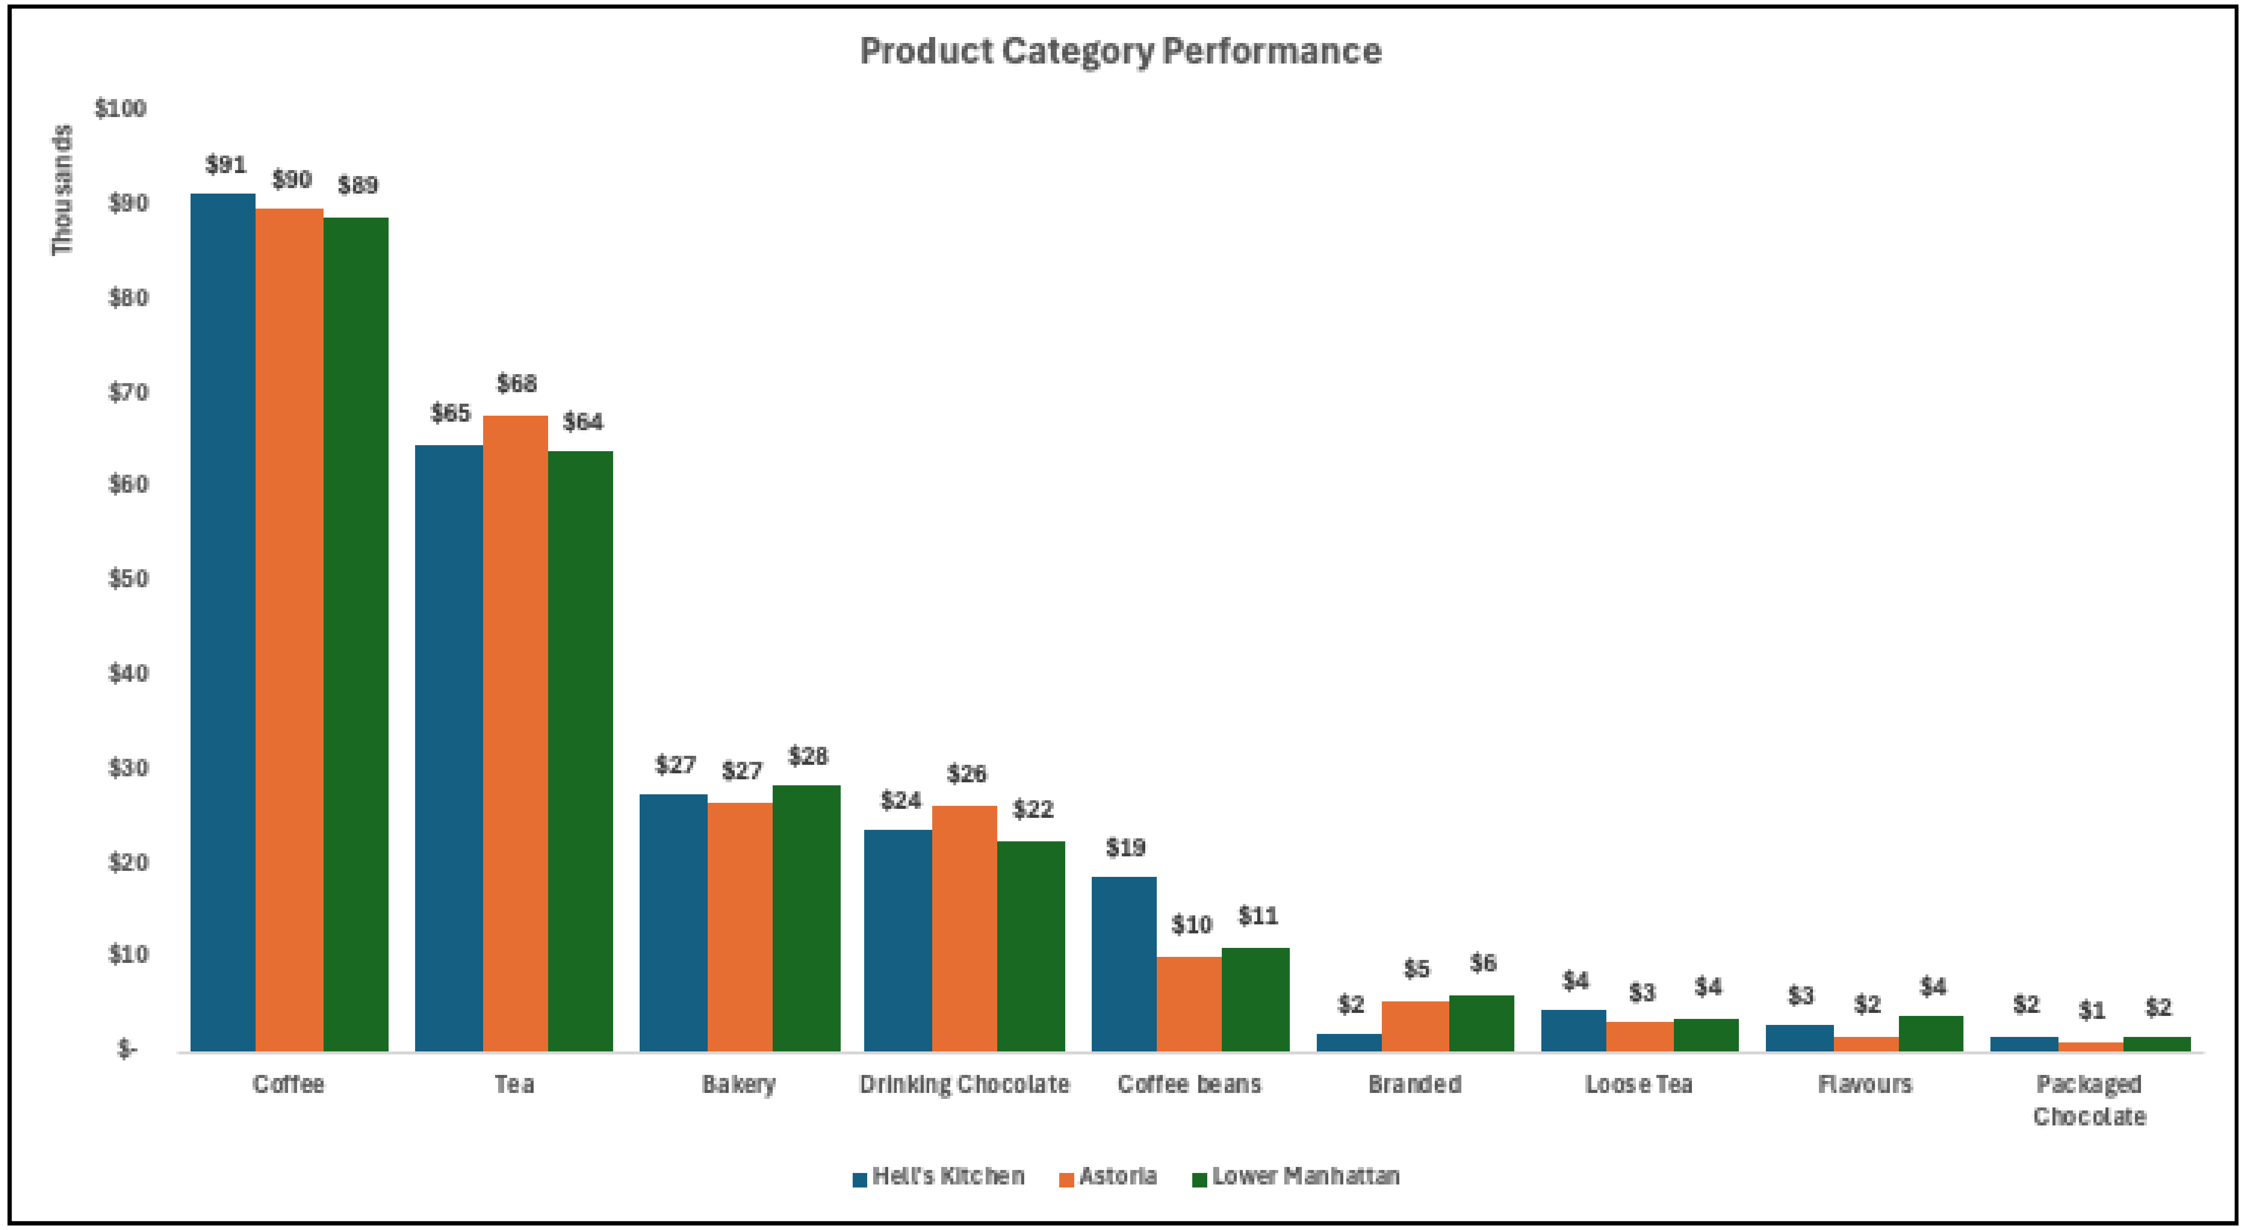
Standardize high performance across all locations

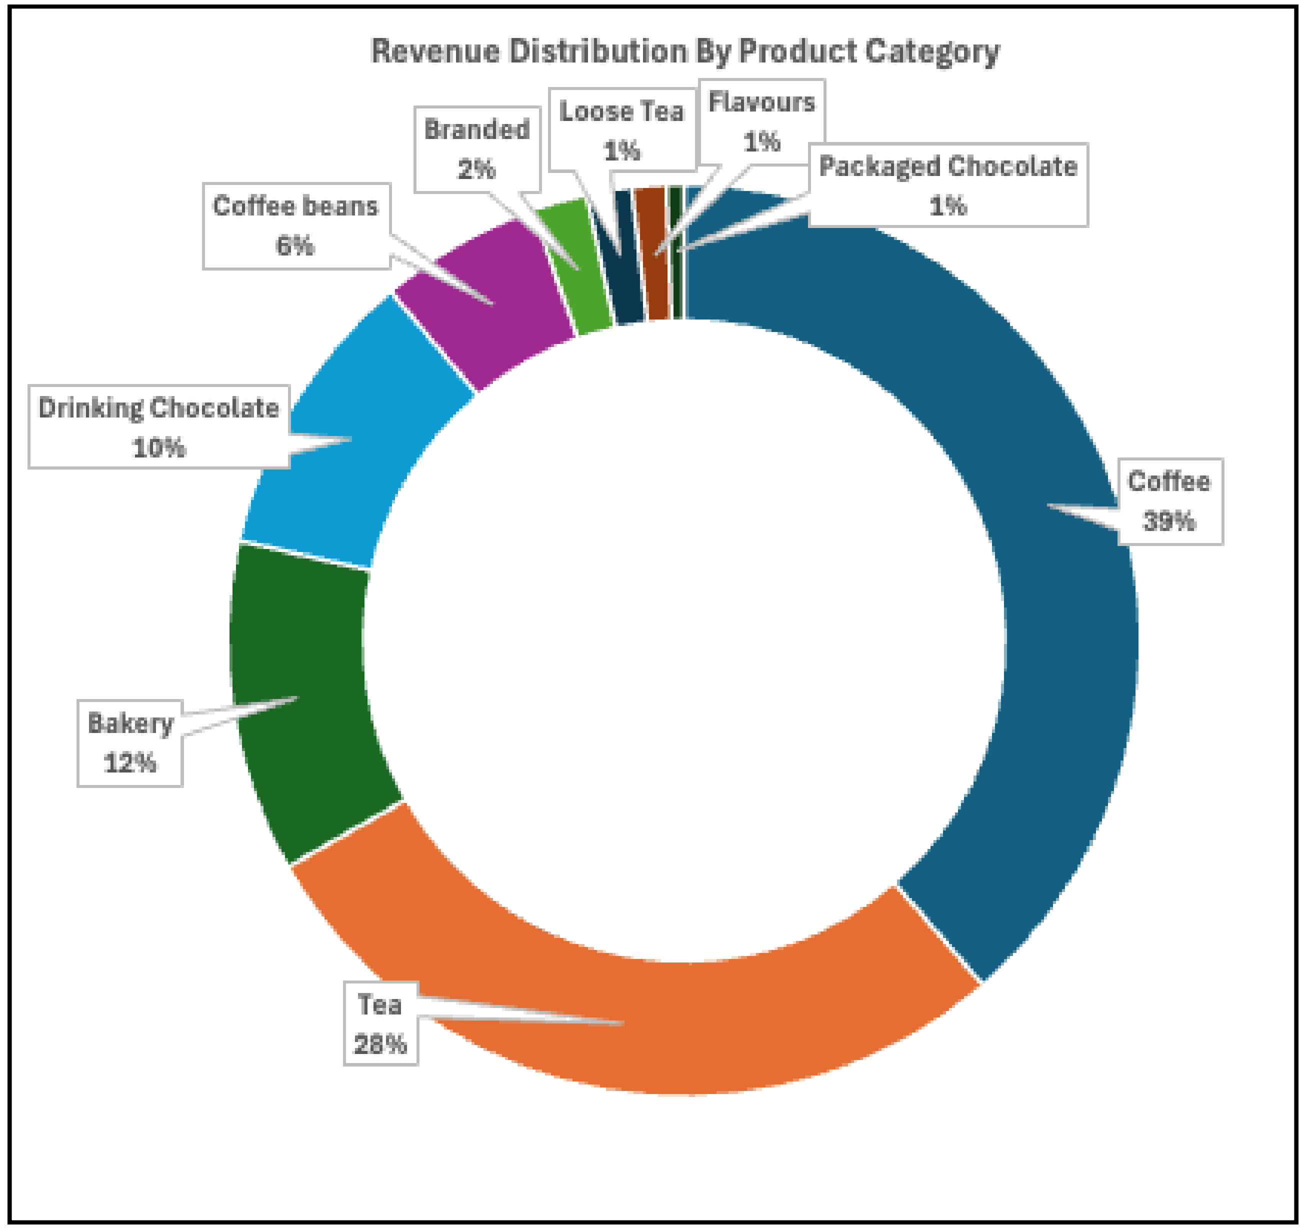
- Benchmark Hell's Kitchen to identify winning factors such as product mix, pricing, and service execution.
- Systematically implement the standard across underperforming stores through targeted product positioning, staff training, and localized promotions.
- Track Performance and scale it based on measurable results.

**Ultimately increase average sales transaction value by 10–20%**

# Revenue Analysis | Regional Revenue Performance

- Coffee is a premium revenue driver across all the stores, contributing 39% to the total revenue, followed by tea at 28% and Bakery at 12%.





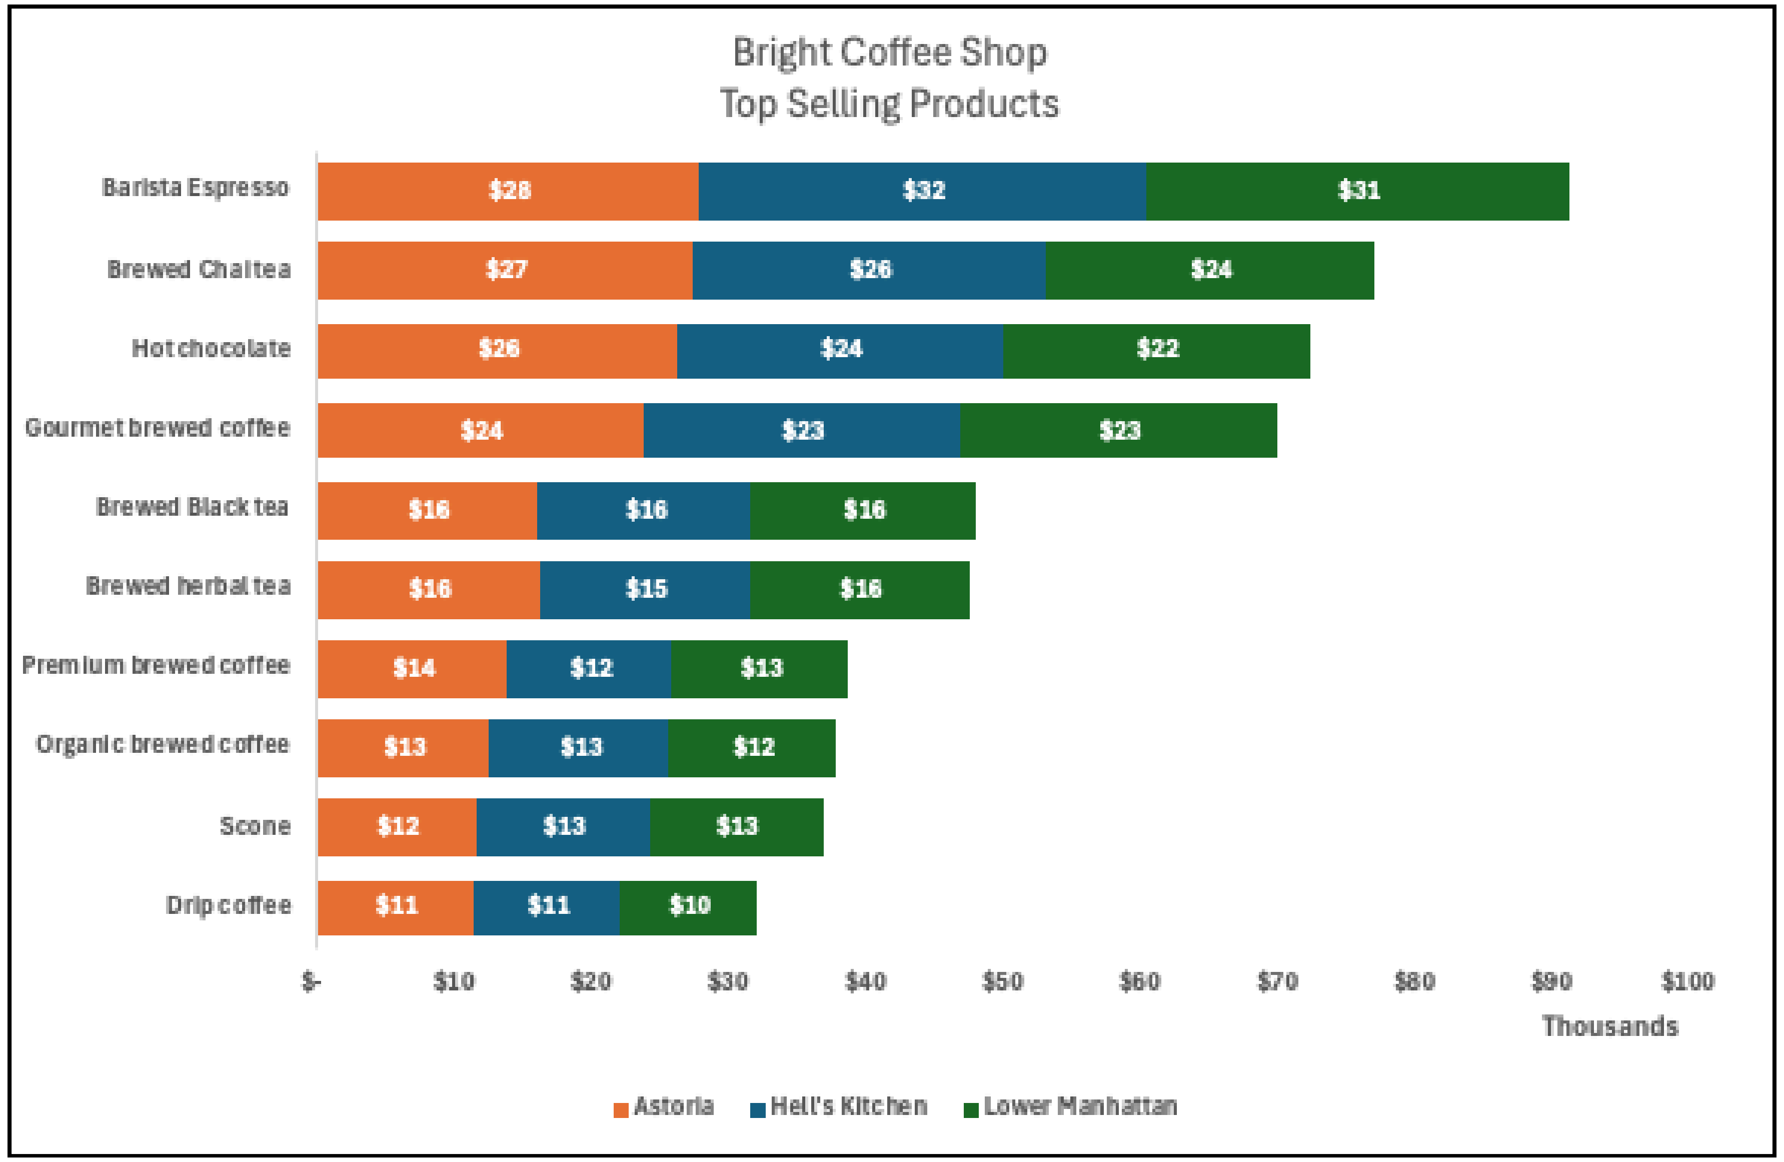
Implement sales promotions

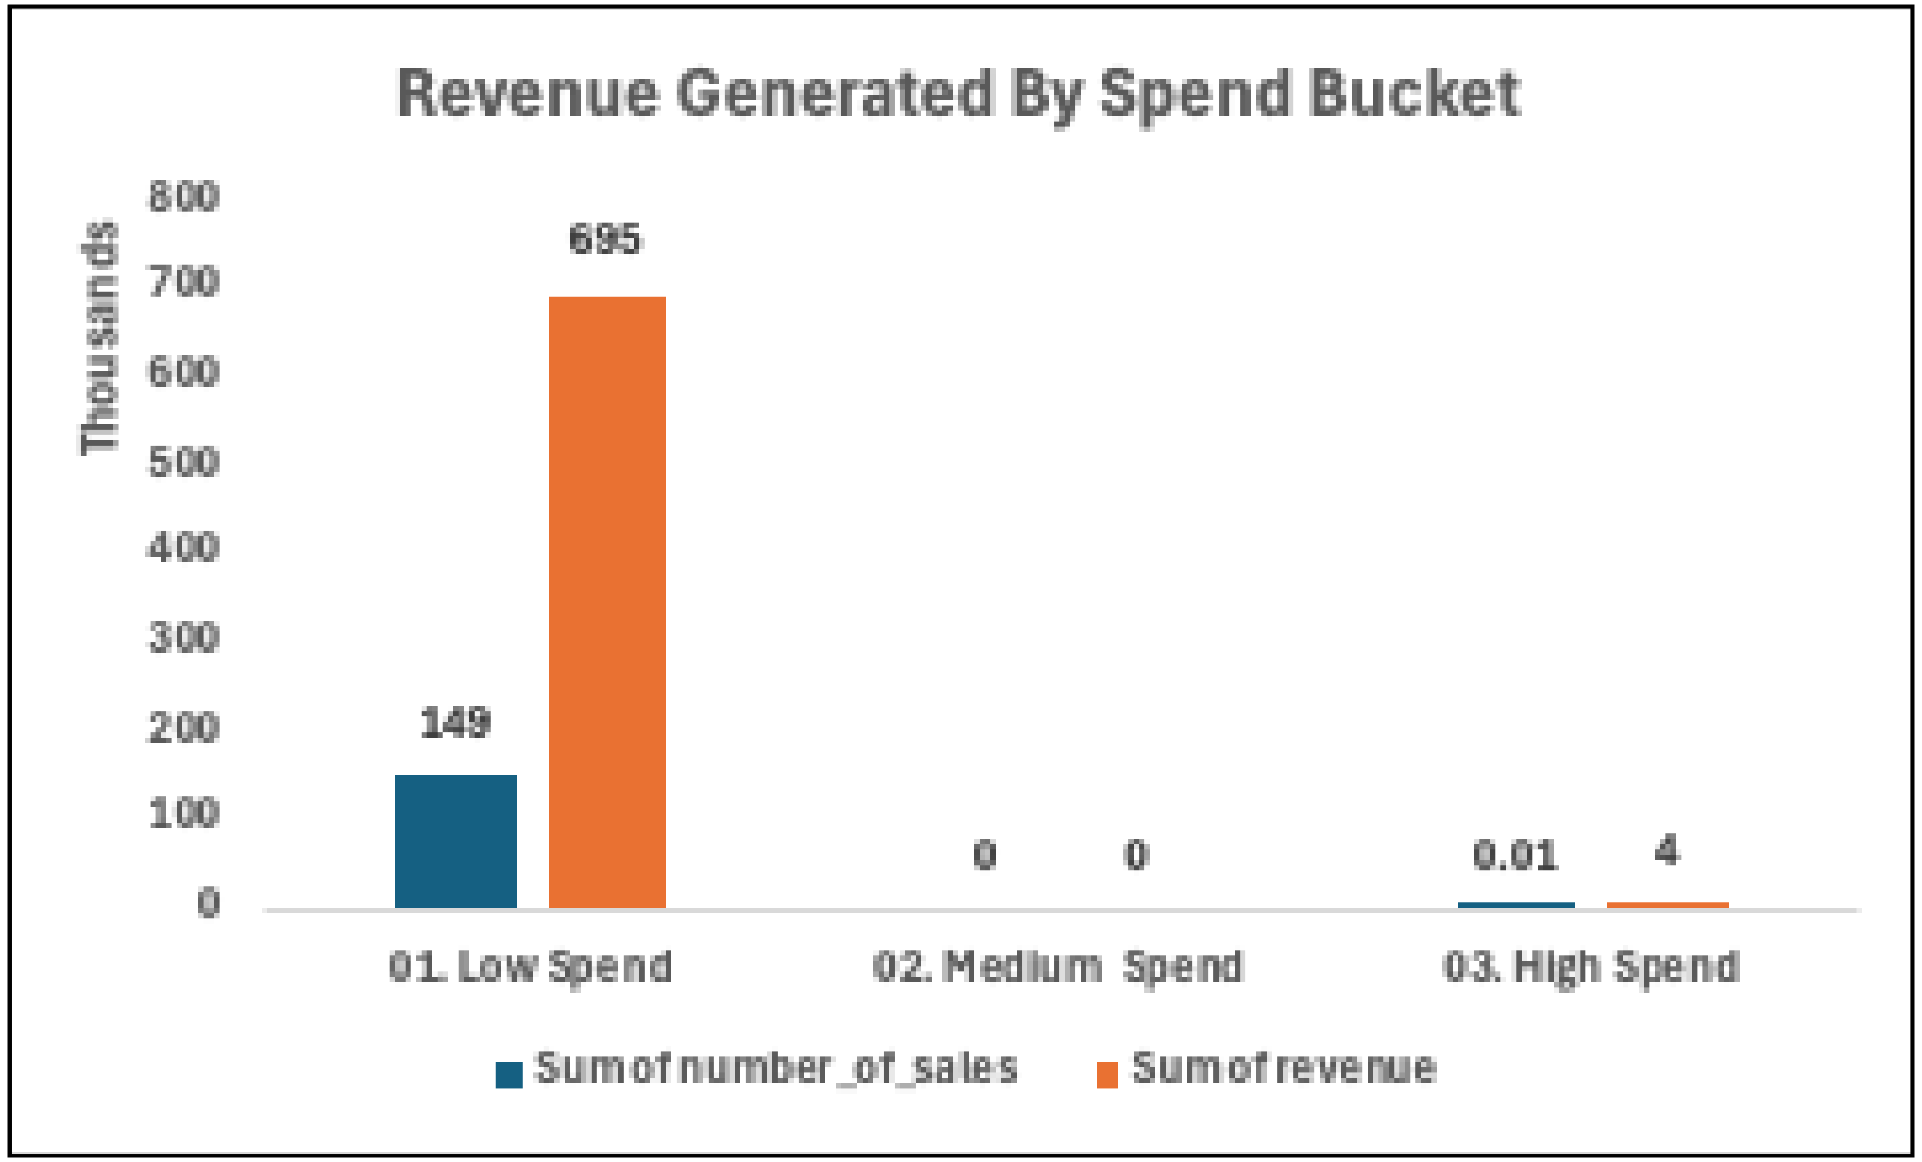
- Sell lower performing products such as flavours and chocolate products to boost sales, making them complementary products at a lower cost.
- Branded sales can be increased by implementing reduced percentage cost promotions when buying high performing products.

**Introducing real time tracking of product sales will enable dynamic promotions and pricing adjustments to boost underperforming categories.This will help Improve underperforming product sales by 15%+**

# Top Selling Products | Product Performance and Customer Behavior

- Premium beverages such as Espresso and Chai Tea drive the majority of revenue, while basic items like Drip Coffee and Scones underperform due to lower perceived value.
- Approximately 99% of revenue is generated from low-spend transactions (1–2 items) which indicate that customers already buy in high-frequency but low value purchasing pattern



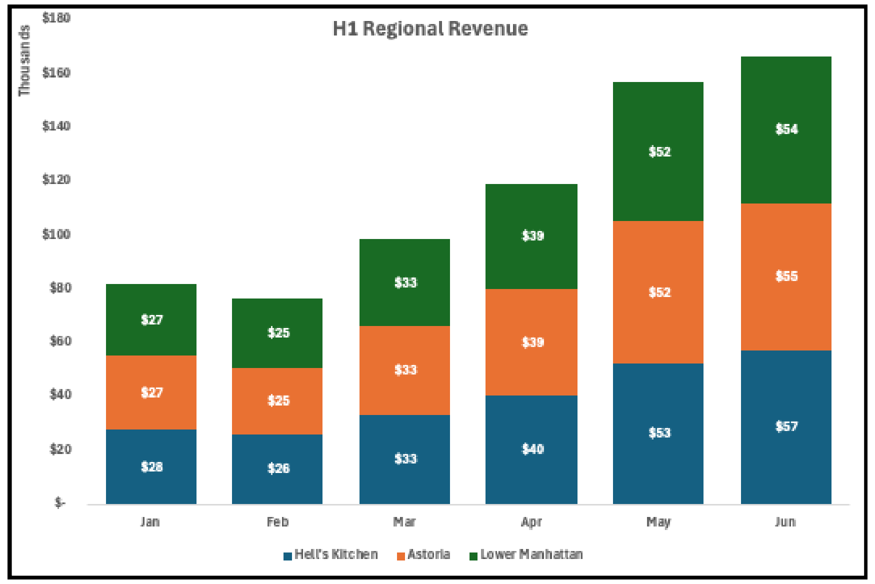


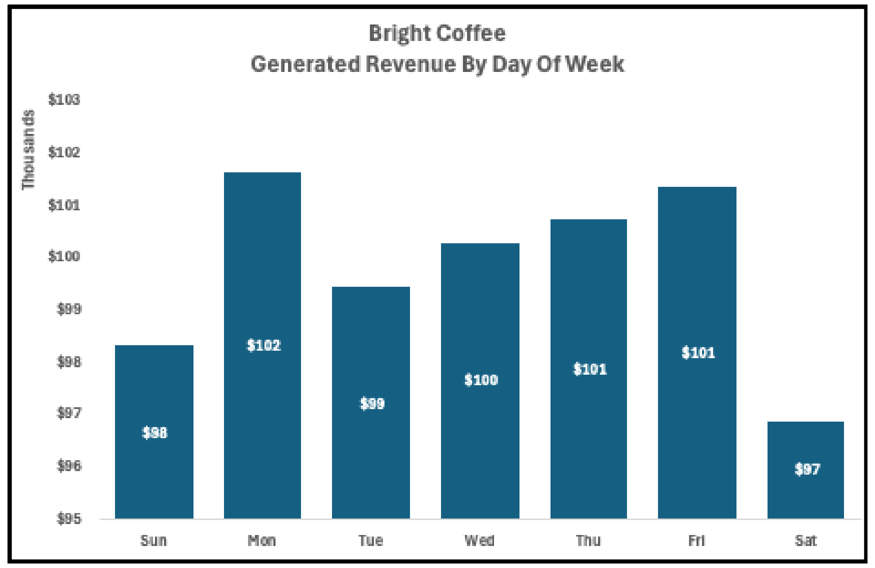
- Introduce a loyalty program that rewards higher spend per visit through points, bundle incentives, and tier-based rewards to encourage multi-item and group purchases.
- Bundle low-performing products with high-performing items, reposition them as premium offerings, and use targeted upselling to increase their contribution to total revenue.
- Increase average transaction value by introducing group buying bundles, upselling strategies, and mid-tier offerings to shift customers from low to higher spend categories.

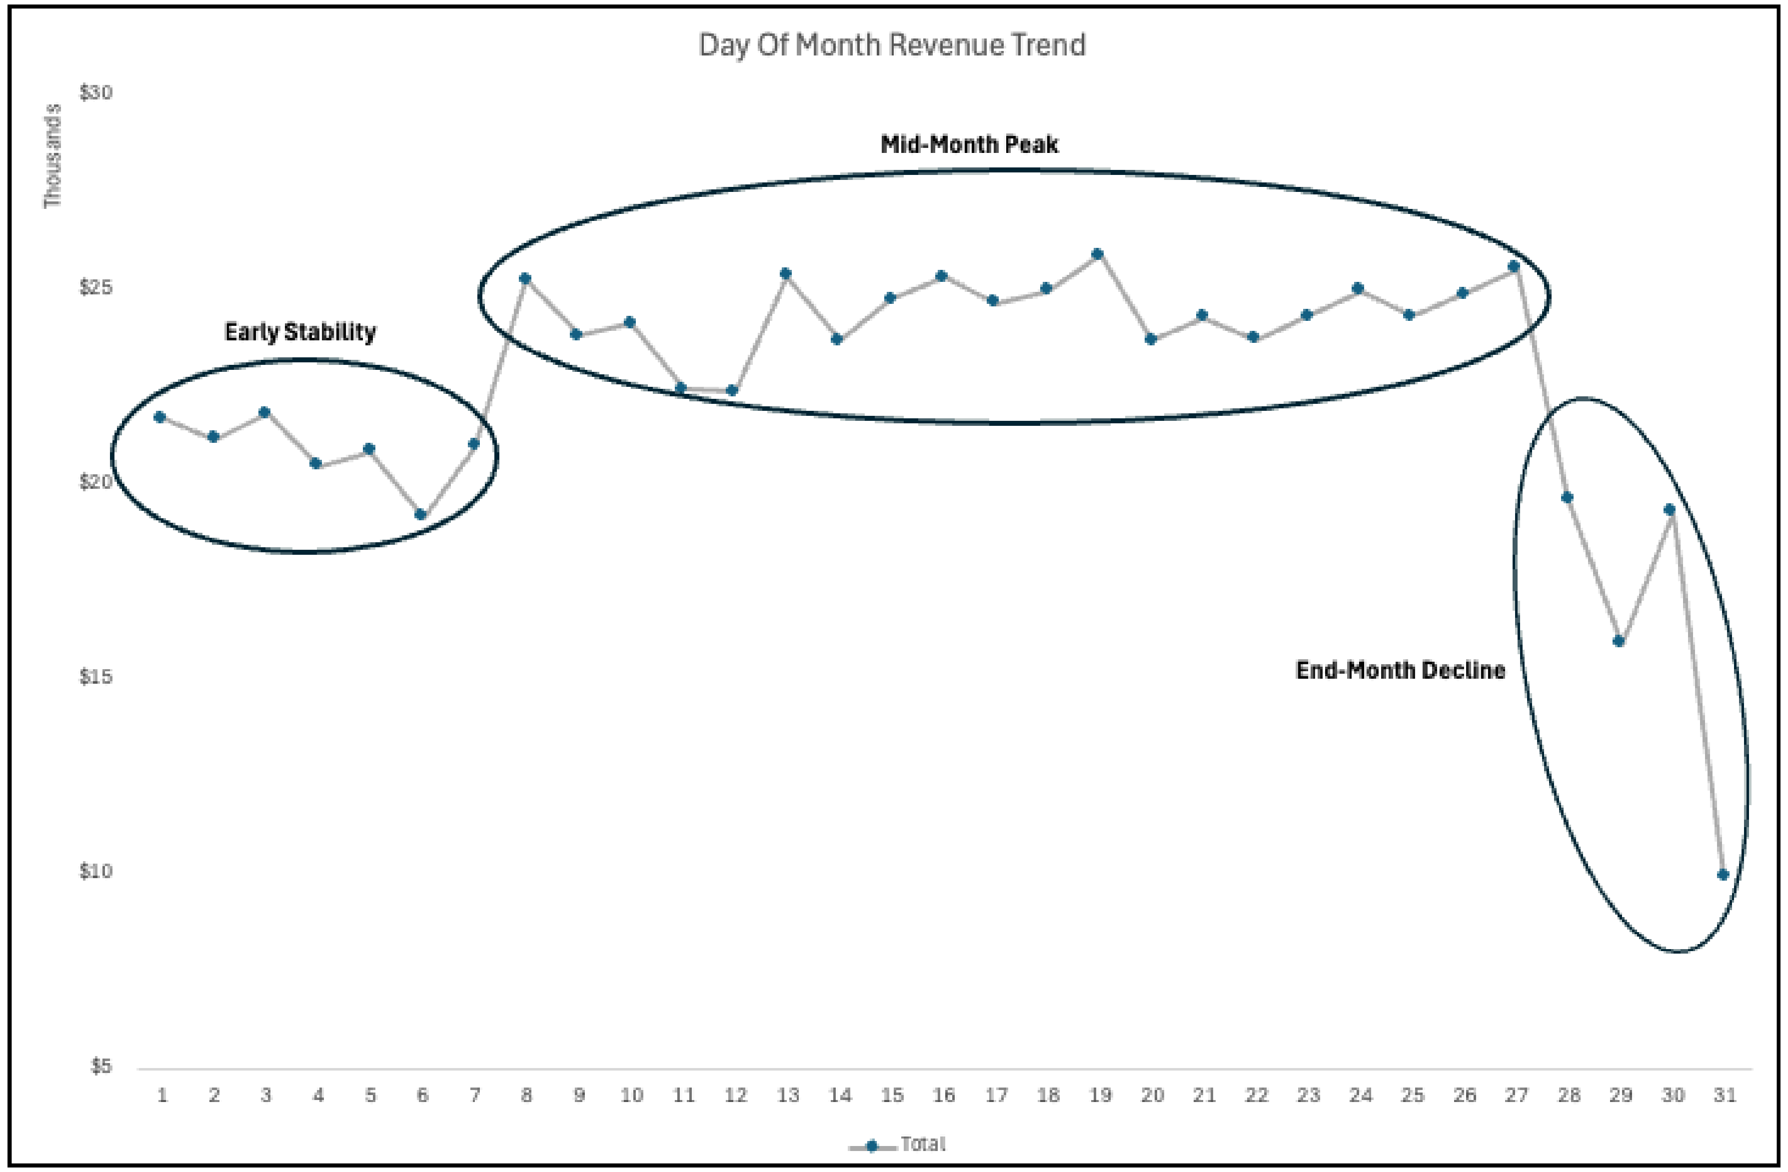
**Real time transaction tracking will support personalized offers and loyalty triggers to increase basket size during active purchase moments**

# Revenue Analysis | Date Performance

- Revenue shows a consistent upward trend across the first six months, with an overall increase of approximately 50%, indicating strong growth in demand and effective business performance.
- Sales indicate a strong weekday driven business cycle, steadily increase towards Friday.
- Revenue remains relatively stable in the first week, peaks strongly between the 8th and 27th, and declines significantly towards the end of the month reflecting customer spending patterns linked to income cycles





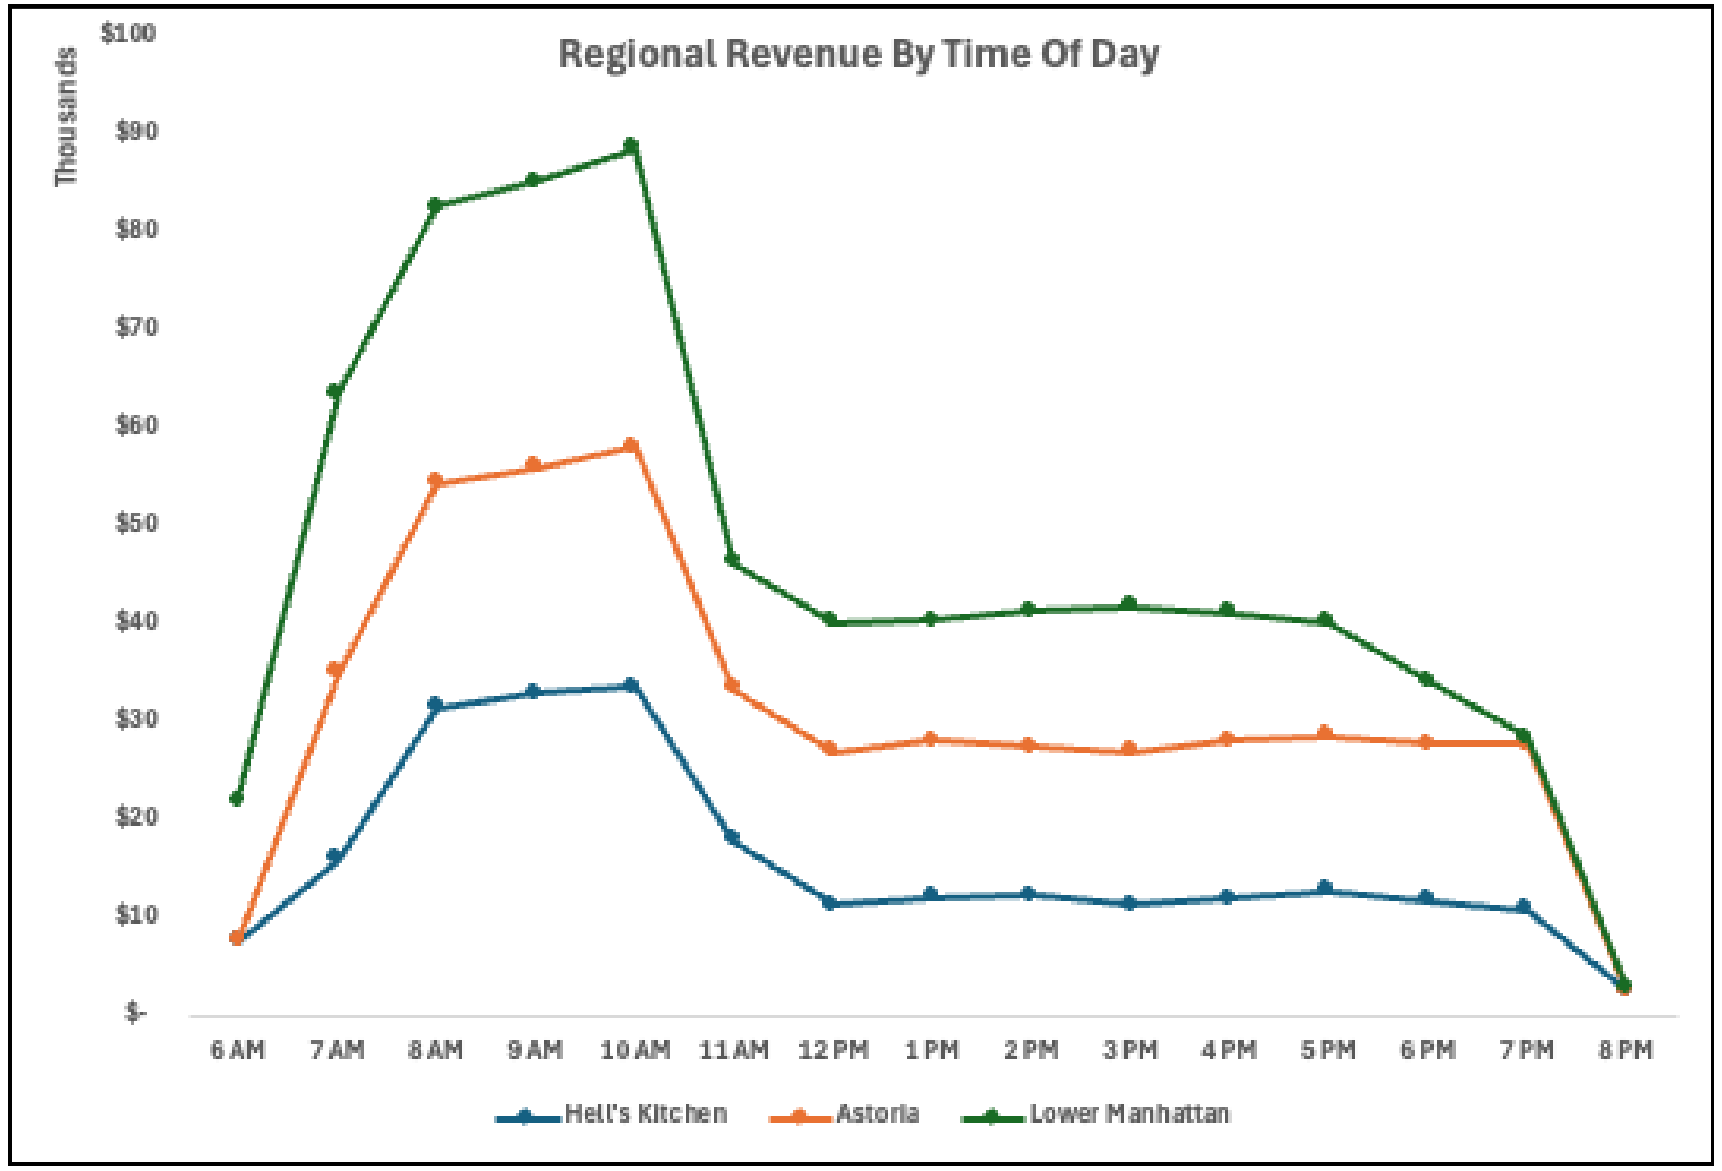


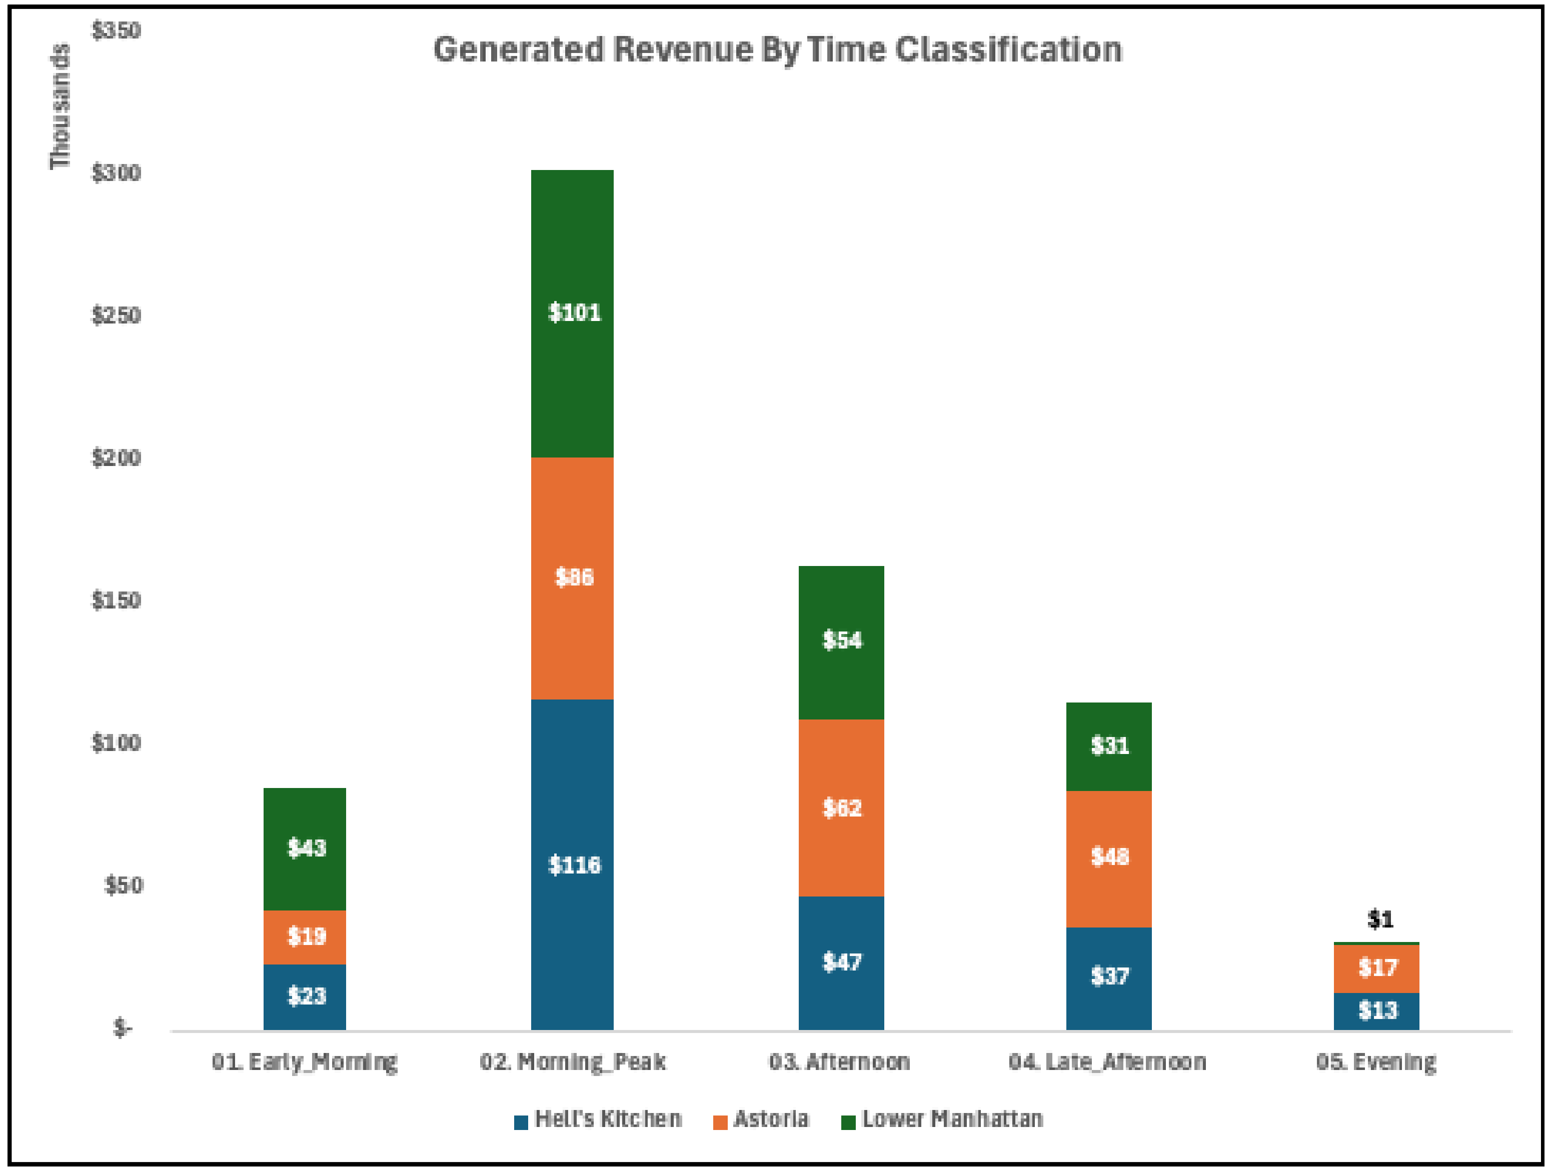
- The business is in a growth phase: the focus should now shift from just growing revenue to scaling sustainably, ensuring operations, staffing, and product availability can support continued demand. Introduce end-of-month value deals and discounts.
- Revenue growth is strong, but uneven: by optimizing low-performing days and periods, we can convert existing demand into consistent, predictable performance

**Real time monitoring of daily revenue will allow immediate deployment of promotions during low performing periods and therefore reduce revenue volatility across time periods**

# Revenue Analysis | Time Performance

- Revenue builds gradually from opening 6am, peaks strongly between 8am and 11am, stabilizes through the afternoon, and then declines sharply in the evening, with minimal contribution after 7pm.





- We're winning the morning, therefore increase staffing during 8–11am to defend our strength and standardize morning peak performance.
- Offer early morning quick breakfast bundles and grab-and-go deals.
- Maximize peak hour efficiency while introducing local targeted promotions and product strategies to grow afternoon and evening sales, reducing reliance on morning revenue.

**Real time hourly dashboards will enable targeted interventions such as staffing adjustments and time based promotions.**

# Real Time implementation strategies | Feature Analysis

Current analysis provides strong historical insights across revenue, products, and customer behavior
The next step is enabling real time visibility to act on trends as they happen
This will transform decision making from reactive to proactive

Real-Time Dashboards

Enable live tracking of revenue, sales volume, and product performance

- Provide continuous visibility across all stores
- Integrate with Google Looker Studio for centralized reporting
- Alerts & Notifications

Trigger automated alerts for sales drops, underperforming products, and off peak performance

- Enable immediate action and faster decision making
- Inventory Integration

Link real time sales data to inventory systems

- Optimize stock levels based on live demand
- Reduce overstocking and prevent stockouts
- Real-time analytics enables proactive decision-making, improves efficiency, and drives consistent revenue growth.

# Executive Insights

**The business is performing well, but the next phase of growth will be driven by real time decision making, enabling us to optimize sales, customer behavior, and operations as they happen.**

- Strong Growth, But Uneven Performance: Revenue increased by 50% from January to June, confirming strong demand. However, performance varies across time, products, and locations.
- High-Value Store Model Identified: Hell's Kitchen generates 34% of revenue compared to 33% of volume and operates as a high-value location. This demonstrates that revenue efficiency can be replicated across other stores.
- Balanced vs Volume-Driven Locations: Astoria performs at equilibrium, while Lower Manhattan is volume-driven. This indicates an opportunity to improve pricing strategies and product mix to achieve higher value sales.
- Revenue is Product Driven, Not Volume Driven: Coffee contributes 39% and tea contributes 28% of total revenue. However, some categories rely more on volume than value, which limits overall profitability.
- High-Margin Products Are Underleveraged: Coffee beans, drinking chocolate, branded products, and packaged chocolate generate higher revenue per unit but are not fully scaled across the business.
- Low Basket Size is the Biggest Constraint: Approximately 99% of transactions are low-spend, consisting of one to two items. This means revenue is driven by customer traffic rather than customer spend.
- Customers Show Predictable Buying Behavior: Strong patterns exist across time, day, and month. These include a morning peak, weekday-driven performance, and a mid-month peak, enabling targeted business strategies.
- Morning Dominates, Evening is Untapped: Revenue peaks between 8 AM and 11 AM, while evenings contribute minimal revenue. This represents a clear opportunity for growth.
- Revenue is Influenced by Customer Cash Cycles: Revenue peaks in the middle of the month and declines towards the end, indicating dependence on customer spending patterns.
- Biggest Growth Lever is Spend Per Customer: Increasing the average transaction value through bundles, upselling, and loyalty programs will unlock the fastest revenue growth.

**This analysis shows us where we are, real time analytics ensures we always know where we're going !!!**
